

# Wrangle Report

This report briefly describes the data wrangling efforts exerted in this project.

In this project we gathered data from a variety of sources and a variety of formats. The dataset that you will be wrangling (and analyzing and visualizing) is the tweet archive of Twitter user @dog\_rates, also known as WeRateDogs. WeRateDogs is a Twitter account that rates people's dogs with a humorous comment about the dog. These ratings almost always have a denominator of 10. The numerators, though? Almost always greater than 10. 11/10, 12/10, 13/10, etc. Why? Because "they're good dogs Brent." WeRateDogs has over 4 million followers and has received international media coverage. The entirety of this project completed inside the Udacity classroom Using Python and its libraries.

## *The Data wrangling, which consists of:*

- Gathering data
- Assessing data
- Cleaning data

We will begin with gathering data

## Gathering data:

A) **Enhanced Twitter Archive:** contains data extracted programmatically from tweet data sent by WeRateDogs to Udacity via email exclusively to be used in this project. The data provides the rating, dog name, dog stage and some other related information.

B) **Image Predictions File:** produced by running every image in the WeRateDogs Twitter archive through a neural network that can classify breeds of dogs\*. The results: a table full of image predictions (the top three only) alongside each tweet ID, image URL, and the image number that corresponded to the most confident prediction (numbered 1 to 4 since tweets can have up to four images).

Tweet image prediction data

C) ***Additional Data via Twitter API*** : obtained by querying Twitter's API then stored in a txt file called tweet-json  
Gathering this data requires a Twitter developer account.

***Assessing Data:*** after gathering data they were assessed visually and programmatically for quality and tidiness issues

The following findings were concluded:

***A) Tidiness***

- Dog stage data is separated into 4 columns.
- All data is related but divided into 3 separate data frames.

***B) Quality***

- There are 181 retweets as indicated by retweeted\_status\_id
- Names are typed with underscore separators
- Invalid tweet\_id data type
- Invalid timestamp data type
- Missing photos for some IDs (2075 rows instead of 2356)
- Some predicted breeds are invalid (not breed of dogs)
- Tweet\_id column is named only id

***Cleaning data***

The previous issues were cleaned in a high quality and tidy master pandas data frame.
